Pred. No. is the number of results predicted by chance to have

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: This is a 'working draft' sequence. It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Insert size: 176000; agarose-fp

```
This sequence encodes a human large tumour suppressor h-lats protein, and has been isolated from a fetal human brain phage lambda-gtl0 cDNA library using a 2.1-kb DNA probe from the mouse m-lats gene (AAT42119). The full-length cDNA is present in plasmid pBS(KS)-h-lats. The gene encodes a putative protein-serine/threonine-kinase, and inhibits cell proliferation and plays a crucial role throughout development. Activators or inhibitors of lats function (e.g. an antisense oligonucleotide or dominant-negative lats fragment) may be used in therapy of cancer or other proliferative disorders,
                                                                                                                                                                                                                                                                                                                                                                                                          degenerative disorders, trauma, growth deficiency, etc., and fragments of the gene may be used as diagnostic probes. A lats-inhibitor sequence may be expressed in a transgenic plant or
                                                                                                                      New isolated large tumour suppressor gene – used to develop prod for inhibiting cell proliferation or for enhancing proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to confer increased growth and inhibit senescence

```

The present sequence is a DNA encoding human Lats (large tumour suppressor) protein which is a cell overproliferation inhibitor and a negative regulator of cell cycle-dependent kinase cdc2/cyclin A. The present sequence is useful for treating cancer that is refractory to standard chemotherapy or radiation therapy such as hyperplasia, metaplasia, or dysplasia, and disorders associated with aberrant levels of cdc2 activity. Conditions treated by promoting cdc2 function include degenerative disorders, growth deficiencies, hypoproliferative disorders, physical trauma, lesions, and wounds. An animal model preferably a mouse, in which a lats gene has been disrupted by homologous

Claim 44; Fig 12; 134pp; English.

recombination, e.g. a lats knock-out mouse, is used for screening compounds that can be used to treat or prevent cancer, particularly skin cancer, soft tissue sarcomas and ovarian tumours, and disorders associated with pituitary dysfunction e.g. luteinizing hormone (LH) hypogonadotropic hypogonadism. The lats DNA is also used in gene therapy.

```
This is the nucleotide sequence of a cDNA clone coding for a human orthologue, i.e. hWaRT1 (see AAV06526). of Drosophila non-receptor serine/threconine kinase WART. hWART1 cDNA was isolated from a human bone marrow, cDNA library using PCR fragments of hWART1 as probes. 3 Polymorphisms were identified in the hWART1 gene: (1) at nucleotide 978, resulting in an Ala/Guy change; (2) at nucleotide 1840, silent; and (3) at nucleotides 3252-3253, comprising a deletion of 2 adenosines, resulting in a C-terminal truncation of hWART1 in the putative kinase domain. The latter frameshift marrow cDNA. Truncation of hWART1 could play a role in disease consmall cell lung cancer, ovarian tumours, central nervous system tumors, renal tumours and breast tumours, and may provide a target to non-small cell lung cancer, ovarian tumours, entral nervous system tumors, renal tumours and breast tumours, and may provide a target coroclogy drug development. Nucleic acids encoding full-length wARRT1 and hWART1 polypeptides lacking one or more of amino acid segments 12-45, 55-151, 236-377, 404-520, 555-559, 601-702, 691-998, cand 1011-1086, or lacking one or more of the N-terminal domain, catalytic domain, or C-terminal domain are claimed, as well as the control of the N-terminal domain, catalytic domain, or C-terminal domain are claimed, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antibodies, a method for identifying modulators of hWART function, and use of such modulator compounds to treat an abnormal condition involving hWART signal transduction, especially cancer. Probes for detection of hWART nucleic acids are also claimed.
New nucleic acid encoding human orthologs of Drosophila WART proteins, used to identify specific modulators for treating or for diagnosis
                                                                                                                                                                                                                                       Claim 1; Page 120-121; 137pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a DNA encoding mouse Lats (large tumour suppressor) protein which is a cell overproliferation inhibitor and a negative regulator of cell cycle-dependent kinase cdc2/cyclin A.

The present sequence is useful for treating cancer that is refractory to standard chemotherapy or radiation therapy such as hyperplasia, on dysplasia, and disorders associated with aberrant levels of cdc2 activity. Conditions treated by promoting cdc2 function include degenerative disorders, proxth deficiencies, hypoproliferative disorders, physical trauma, lesions, and wounds: An animal model preferably a mouse, in which a lats gene has been disrupted by homologous recombination, e.g. a lats knock out mouse, is used for screening compounds that can be used to treat or prevent cancer, particularly skin cancer, soft tissue sarcomas and ovarian tumours, and disorders associated with pituitary dysfunction e.g. luteinizing hormone (LH) hypogonadotropic hypogonadism. The lats DNA is also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                           Use of lats proteins, complexes of lats and cdc2 for treating cancer that is refractory to treatment by standard chemotherapy and radiation therapy, and disorders associated with aberrant levels of cdc2 activity
                                                                                                                                                                                                                                                                   ŝ

                                                                                                                                                                                                               This sequence encodes a mouse large turmour suppressor m-lats protein, and has been isolated from a newborn mouse brain phage lambda 2AP cDNA library using a 2.2-kb DNA probe from the Drosophila lats gene (AAT42117). A homologous mouse sequence has also been isolated (m-lats2, AAT42120). The gene encodes a putative protein-serine. The gene encodes a putative protein-crucial role throughout development. Activators or inhibitors of lats function (e.g. an antisense oligonucleotide or dominant-negative
                                                                                                                                                                                                                                                                                                           lats fragment) may be used in therapy of cancer or other proliferative disorders, degenerative disorders, trauma, growth deficiency, etc., and fragments of the gene may be used as diagnostic probes. A lats inhibitor sequence may be expressed in a transgenic plant or farm animal to confer increased growth and inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CCACCACCTCCAAGAGGCCAGACTCCCCCTCCAAGAGGTACAACTCCACCTCCCCCTTCA 1031

```

polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; has memorated activity; cell proliferation or cell immunomodulatory activity; activit, or inhibin related activities; chrombotic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

CC thrombolytic activities; polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders telinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., myeloid or lymphoid cell conditions, bone disorders (e.g., osteoporosis), and abnormal crepair or netlinopathy atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal crepair (or nucleic acids encoding them) may be used to promote wound the immunomodulatory activities may be used in the treatment of viral, and phymorial and dingal indettions in addition to immune disorders. nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the Polypeptides with growth factor activity may be used in cell cultures t promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells autoimmune disease or accidental damage. The polypeptides and nucleoti may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding that can be used to augment or replace cells damaged by novel human polypeptide of the invention.

The invention relates to a human warts protein, homologous to Drosophilia warts gene expression product. The warts expression product is a protein kinase involved in the regulation of proliferation and differentiation of epithelial cells and suppression of tumour formation. The gene, its expression product and antibodies are useful in the study of the mechanisms of tumour development. The present sequence represents a human warts gene fragment encoding a partial peptide fragment.

WPI; 2000-246496/21. P-PSDB; AAY70392. Use of lats proteins, complexes of lats and cdc2 for treating cancer that is refractory to treatment by standard chemotherapy and radiation therapy, and disorders associated with aberrant levels of cdc2 activity

Claim 44; Pages 112-117; 134pp; English.

The present sequence is a DNA encoding mouse Lats2 (large tumour suppressor) protein which is a cell overproliferation inhibitor and a negative regulator of cell cycle-dependent kinase cdc2/cyclin A. The present sequence is useful for treating cancer that is refractory to standard chemotherapy or radiation therapy such as hyperplasia, to syplasia, and disorders associated with aberrant levels of cdc2 activity. Conditions treated by promoting cdc2 function include degenerative disorders, growth deficiencies, hypoproliferative preferably a mouse, in which a lats gene has been disrupted by homologous recombination, e.g. a lats knock-out mouse, is used for screening compounds that can be used to treat or prevent cancer, particularly skin cancer, soft tissue sarcomas and ovarian tumours, and disorders associated with pituitary dysfunction e.g. luteinizing hormone (LH) hypogonadotropic hypogonadism. The lats DNA is also used in gene therapy.

The MGHITS proteins can be used in an annineoplastic pharmaceutical preparation. Probes for the MGHITS DNA sequences can be used in diagnostic pharmaceutical preparations. The diagnostic pharmaceutical preparations can be used for examining expression of hGHITS genes in dwarfism, agigantism, acromagaly, anglopathy, diabetic nephropathy or cardiopathy, or in malignant
